Python-21 March 2022

Batch-DS250322

Sagar Sarkar

Day 8-13 April Python Loops

- help() builtin function
- Nested for loop Practice
- Loops Practice
- Practice Questions on Loops

Help Function

- The **Python help function** is used to display the documentation of modules, functions, classes, keywords, etc.

- The help function has the following syntax:

```
help([object])
```

- Python help() function arguments

```
object: Call help of the given object.
```

- If the help function is passed without an argument, then the interactive help utility starts up on the console
